EXPERIMENT 07

Zoho Service Integration

Project: Hotel Booking using Low-Code in Zoho Creator

AIM

To integrate the Hotel Booking application in Zoho Creator with an external service or Zoho service to support booking-related communication and data exchange.

REQUIREMENTS

- Zoho Creator application with Rooms and Bookings forms
- A configured connection only if an external API is actually used
- Sample booking record for testing

DESIGN / MODULES

Form / component	Purpose
Rooms	Room ID, room type, capacity, price per night, availability status
Bookings	Guest name, email, room, check-in, check-out, number of guests, booking status
Integration log (optional)	Request status, response message, date/time

PROCEDURE

1. Open the Hotel Booking application in Zoho Creator and identify the Bookings form and required fields.
2. Choose the service to integrate, such as an email notification service or an approved hotel/availability API.
3. Create and authorize a connection using the service's supported authentication method. Do not place secret keys directly in form scripts.
4. Configure a workflow to run when a booking is submitted or its status changes.
5. Map the booking ID, guest contact, room, dates, and status to the service request or notification template.
6. Test with a sample booking. Review the response and log success or failure; do not treat an unverified API call as successful.

SAMPLE LOGIC / OUTPUT

```
// Illustrative Deluge-style pseudocode; replace field/link names and configure a real connection first. if(input.Booking_Status == "Confirmed") {     // Send a confirmation using your configured notification action.     info "Confirmation workflow triggered for booking: " + input.ID; }
```

TEST CASES

Test	Expected outcome
Confirmed booking	Confirmation workflow is triggered
Pending booking	Confirmation is not sent as confirmed
Integration failure	Failure is recorded and can be reviewed

RESULT

The service-integration workflow is designed and test cases are defined. A real integration is complete only after the connection is authorized and a successful response is verified.
