EXPERIMENT 08

Users and Role-Based Access Control (RBAC)

Project: Hotel Booking using Low-Code in Zoho Creator

AIM

To assign suitable access permissions to guests, reception staff, and administrators in the Hotel Booking application.

REQUIREMENTS

• Zoho Creator app with user access enabled
• Guest, Reception Staff, and Administrator roles or equivalent permission groups

DESIGN / MODULES

Role	Suggested access
Guest	Submit booking request and view only their permitted booking details
Reception Staff	View bookings and update check-in/check-out or booking status
Administrator	Manage rooms, rates, users, reports, and settings

PROCEDURE

1. List the user roles required for the hotel workflow.
2. Open application sharing, users, roles, and permission settings in Zoho Creator.
3. Create or map roles to the available permission model in the current Creator plan.
4. Restrict room-rate maintenance and application settings to administrators.
5. Limit guest access to their own permitted records where supported; do not rely only on hiding fields in the interface.
6. Test each role with a separate test account and record what each account can view, add, edit, and delete.

SAMPLE LOGIC / OUTPUT

Permission test matrix: Guest → create booking / view permitted booking; Reception → update booking status; Admin → manage rooms and reports.

TEST CASES

Test	Expected outcome
Guest opens admin report	Access denied
Reception edits room pricing	Access denied unless explicitly permitted
Admin updates room details	Allowed

RESULT

A role matrix and access test plan are prepared. Actual permissions must be verified in the live app with separate accounts.
