EXPERIMENT 09

Zia and Built-in Analytics

Project: Hotel Booking using Low-Code in Zoho Creator

AIM

To explore built-in analytics and available Zia features for understanding hotel booking activity.

REQUIREMENTS

- Sample Rooms and Bookings data
- Creator reports or dashboard components
- Zia features if enabled for the account and plan

DESIGN / MODULES

Metric	Use
Bookings by status	Compare pending, confirmed, cancelled, and completed bookings
Room-type demand	Identify room types receiving more bookings
Occupancy overview	Compare booked room nights with available room nights
Revenue estimate	Sum confirmed booking amounts for the selected period

PROCEDURE

1. Enter a small set of sample rooms and bookings with varied dates and statuses.
2. Create a report grouped by Booking Status and another grouped by Room Type.
3. Add suitable charts or summary panels to a dashboard.
4. Use filters for date range, room type, and booking status.
5. If Zia is available, try a supported natural-language or analytics feature and check its output against the sourcerecords.
6. Record the exact result. If the feature is unavailable or fails, use the built-in report/chart and document the limitation.

SAMPLE LOGIC / OUTPUT

Example dashboard cards: Total bookings | Confirmed bookings | Available rooms | Estimated confirmed revenue. Use actual app data rather than fabricated metrics.

TEST CASES

Test	Expected outcome
Filter status = Confirmed	Only confirmed records contribute
Change date range	Charts and totals update
Compare total with source records	Summary matches the underlying report

RESULT

A booking analytics dashboard can summarize booking status, demand, and estimated revenue. Zia availability and output must be verified in the user's Creator environment.
