EXPERIMENT 11

Development to Production

Project: Hotel Booking using Low-Code in Zoho Creator

AIM

To plan a safe release of the Hotel Booking application from development/testing to production use.

REQUIREMENTS

- Development version of the app
- Test data and test cases
- Authorized access to deployment or publish controls

DESIGN / MODULES

Stage	Main task
Development	Build forms, reports, workflows
Testing	Verify booking, availability, permissions, and notifications
Production	Publish only after approval and final checks
Rollback plan	Keep a known-good version and document recovery steps

PROCEDURE

1. Complete the room, booking, guest, report, and workflow configuration in development.
2. Prepare test cases for valid booking, invalid dates, room unavailability, cancellation, and permissions.
3. Check connections, environment-specific settings, and notification recipients before release.
4. Use the deployment or publish process available in the current Zoho Creator account.
5. Ask an authorized reviewer to approve the release and confirm production access.
6. Run a small post-release smoke test and document the version, date, issues, and rollback approach.

SAMPLE LOGIC / OUTPUT

Release checklist: forms verified; reports verified; workflows verified; permissions tested; connection settings checked; backup/version noted; reviewer approval recorded.

TEST CASES

Test	Expected outcome
Submit test booking after release	Record is saved correctly
Unavailable room selected	Booking is rejected or kept pending
Guest account opens restricted area	Access is denied

RESULT

A release and verification plan is prepared. Do not state that production deployment occurred unless the live publish step has actually been completed.
