EXPERIMENT 13

# Low-Code Limitations: Case Study

**Project:** Hotel Booking using Low-Code in Zoho Creator

## AIM

To evaluate the benefits and limitations of using a low-code platform for a Hotel Booking application.

## REQUIREMENTS

- Hotel Booking use case
- List of core requirements and possible growth needs

## DESIGN / MODULES

| Requirement | Low-code fit / consideration |
|---|---|
| Room and booking forms | Good fit for rapid form-based development |
| Status notifications | Suitable for workflow automation, subject to configured service limits |
| Complex pricing rules | May require custom functions and extensive testing |
| High-volume concurrent bookings | Requires careful validation, capacity checks, and platform-limit review |
| External payment gateway | Requires secure integration, compliance review, and tested error handling |

## PROCEDURE

1. Define the core hotel workflow: room listing, booking request, confirmation, check-in, and cancellation.
2. Map each requirement to Creator forms, reports, workflows, or custom functions.
3. Identify dependencies such as external services, plan limits, API limits, and permissions.
4. Assess risks including double booking, inaccurate availability, data exposure, and service failure.
5. Recommend controls such as availability validation, role-based access, logs, and manual review for exceptions.
6. Summarize which requirements fit low-code directly and which need extra engineering or specialist review.

## SAMPLE LOGIC / OUTPUT

Case-study conclusion: low-code can accelerate standard forms, reports, and workflow automation; payment, concurrency, complex pricing, and large-scale integrations require additional design and verification.

## TEST CASES

| Scenario | Discussion point |
|---|---|
| Two guests request the same room dates | Prevent double booking through a tested availability-check design |
| External service unavailable | Show a clear status and provide a safe retry or manual review |
| Requirement exceeds platform limits | Evaluate supported extension or an alternative architecture |

## RESULT

The case study shows where low-code supports rapid development and where platform limits, integration complexity, and risk controls must be evaluated.
