EXPERIMENT 14

Pro-Code Custom Functions

Project: Hotel Booking using Low-Code in Zoho Creator

AIM

To design a custom function for validating booking dates and calculating the number of nights and estimated booking cost.

REQUIREMENTS

• Bookings form with check-in, check-out, room rate, and guest details
• A custom function or workflow action supported by the Creator account

DESIGN / MODULES

Input	Validation / use
Check-in date	Must be present
Check-out date	Must be later than check-in
Rate per night	Must be zero or positive
Output	Number of nights and estimated room cost

PROCEDURE

1. Identify the actual field link names in the Bookings and Rooms forms.
2. Create a custom function or workflow action using the Deluge editor supported by the account.
3. Validate required dates and ensure check-out occurs after check-in.
4. Calculate the number of nights and multiply by the applicable nightly rate.
5. Return or store the calculated value using the correct field link names.
6. Test same-day, reversed-date, missing-rate, and valid multi-night cases before using the function in the live workflow.

SAMPLE LOGIC / OUTPUT

```
// Illustrative logic only; adjust field link names and date syntax to your Creator
app. if(input.Check_In != null && input.Check_Out != null && input.Check_Out >
input.Check_In) {     nights = daysBetween(input.Check_In, input.Check_Out);
estimated_cost = nights * input.Rate_Per_Night;     info estimated_cost; } else {
info "Please enter a valid check-in and check-out date."; }
```

TEST CASES

Input	Expected outcome
Check-in 10 Nov, check-out 13 Nov, rate 2000	3 nights; estimated room cost 6000
Check-out earlier than check-in	Validation message; no cost calculation
Missing date	Validation message

RESULT

The custom-function logic and test cases are documented. The example is illustrative and must be adapted to the actual Creator field names and Deluge syntax before deployment.
