EXPERIMENT 15

Careers and Future of Low-Code

Project: Hotel Booking using Low-Code in Zoho Creator

AIM

To study career opportunities and future trends related to low-code application development using a Hotel Booking project as an example.

REQUIREMENTS

- Understanding of low-code concepts
- Hotel Booking project summary
- Examples of forms, reports, workflows, and integrations

DESIGN / MODULES

Role / area	Relevant skills
Low-code developer	Forms, reports, workflows, data modelling
Business analyst	Requirements gathering and process mapping
Automation specialist	Workflow design, testing, integrations
Application administrator	Access control, governance, release management
Solution architect	Integration design, scalability, risk assessment

PROCEDURE

1. Summarize the purpose and main modules of the Hotel Booking application.
2. Identify low-code skills demonstrated by forms, reports, workflows, validation, and dashboards.
3. Describe how developers collaborate with business users to convert requirements into an application.
4. Discuss future-facing skills such as API integration, security, data quality, testing, and custom functions.
5. Explain that low-code reduces repetitive development but does not remove the need for design, testing, and governance.
6. Prepare a short project presentation with architecture, key workflows, limitations, and possible future enhancements.

SAMPLE LOGIC / OUTPUT

Future enhancements: room availability calendar, cancellation policy workflow, customer feedback form, occupancy dashboard, and secure payment integration after a proper review.

TEST CASES

Evaluation area	Evidence to present
Requirements	Mapped requirements to app modules
Automation	Show a tested workflow or documented test case
Security	Show the role matrix and validation rules
Future scope	Prioritized improvements with risks noted

RESULT

The project demonstrates practical low-code concepts and relates them to roles in application development, analysis, automation, administration, and solution design.
