EXPERIMENT 07: Zoho Service Integration for Hotel Booking

Aim: To study how a Zoho Creator hotel booking app can connect with another service and exchange booking information securely.

Requirements: Zoho Creator account, Hotel Booking form, and an external service or Zoho service suitable for the required integration.

Procedure

1. Open the app and identify the event that should trigger the integration, such as a booking being confirmed.
2. Choose the supported integration route: a Zoho connection, a built-in integration task, or an authorized API call.
3. Create the connection with only the permissions required. Keep tokens and secrets out of visible fields and shared screenshots.
4. Map booking fields such as booking ID, guest name, room, check-in, check-out, and status to the receiving service.
5. Add error handling and record whether the integration succeeded or failed.
6. Test with a non-sensitive sample booking and inspect the destination service before treating the integration as successful.

Illustrative Deluge / Integration Template

```
// Deluge template — replace link names and connection name.
// Use only after creating and authorizing the connection.
// payload = Map();
// payload.put("booking_id", input.ID.toString());
// payload.put("check_in", input.Check_In.toString("yyyy-MM-dd"));
// payload.put("check_out", input.Check_Out.toString("yyyy-MM-dd"));
// payload.put("status", input.Booking_Status);
// response = invokeurl
// [
// url : "https://example.com/api/bookings"
// type : POST
// parameters : payload
// connection : "your_authorized_connection"
// ];
// info response;
```

Validation / Discussion

Verify that authorization is granted, the request uses the expected field mapping, and an error is shown or logged if the service is unavailable. The example endpoint is a placeholder and is not a live integration.

Result

The integration design and test procedure for sharing hotel booking information with an authorized service are documented.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
