# EXPERIMENT 08: Users, Roles and Role-Based Access Control

**Aim:** To define user roles and restrict hotel booking data and actions according to each user's responsibilities.

**Requirements:** Zoho Creator app with Guest Details, Room Details, and Hotel Booking forms/reports.

## Procedure

1. Open the app's user and permission settings.
2. Define the Administrator role for configuration and full operational oversight.
3. Define the Receptionist role for creating guest and booking records and updating permitted booking details.
4. Define the Manager role for viewing booking summaries, occupancy information, and reports.
5. Assign access to forms, reports, and actions using the permissions available in the account.
6. Sign in or test using separate test users for each role; do not rely only on the app owner's view.

## Design / Test Table

| Role | Typical access | Restrictions |
|---|---|---|
| Administrator | Manage forms, users, settings and records | Protect admin account and credentials |
| Receptionist | Create guest/booking records; view room availability | No user/permission administration |
| Manager | View reports and booking summaries; approve permitted status changes | Limit editing of guest details where appropriate |

## Validation / Discussion

Check that a receptionist cannot open administrative settings and that a manager can access only the intended reports. Exact permission behavior depends on the app configuration and subscription.

## Result

A role matrix and permission-test plan are prepared for the hotel booking application.

## Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
