EXPERIMENT 09: Built-in Analytics and Booking Reports

Aim: To create reports and dashboards that help staff understand booking volume, room status, and revenue estimates.

Requirements: Sample booking records with check-in/check-out dates, room type, booking status, and total amount.

Procedure

1. Create an All Bookings report based on the Hotel Booking form.
2. Create a report filtered to confirmed bookings and another for cancelled bookings.
3. Create a room availability report using Room Status and the booking workflow's availability logic.
4. Add a chart grouped by Booking_Status or Room_Type.
5. Create a summary for total confirmed booking value and number of bookings for a selected period.
6. Check the filters and totals against a small set of manually verified sample records.

Design / Test Table

Report / chart	Suggested measure	Use
Booking status chart	Count of bookings by status	Track confirmations and cancellations
Room type chart	Count of bookings by room type	Understand demand
Booking value summary	Sum of Total_Amount for confirmed bookings	Estimate booking value, not necessarily collect
Upcoming check-ins	Check_In within a selected date range	Support reception planning

Validation / Discussion

Confirm that cancelled bookings are excluded from confirmed booking value and that report filters return the expected sample records. Availability should account for overlapping date ranges, not just a room's static status.

Result

Reports and chart designs for hotel operations are specified and can be verified using sample records.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
