EXPERIMENT 10: Performance Optimization

Aim: To improve the usability and responsiveness of the hotel booking app by reducing unnecessary processing and keeping reports focused.

Requirements: Hotel Booking and Room Details forms with sample data; reports and workflows that can be tested.

Procedure

1. Record a baseline for a repeatable task, such as opening a booking report with the same filters.
2. Remove unused fields from frequently used forms and show only relevant fields where possible.
3. Use report criteria to narrow records by status or date instead of loading every record into a page.
4. Avoid repeated searches inside loops; retrieve the needed data once where practical.
5. Keep workflow logic simple and avoid triggering duplicate updates or notifications.
6. Repeat the same test and compare the observed results. Record the test conditions and sample size.

Illustrative Deluge / Integration Template

```
// Deluge design pattern: fetch a relevant set once,
// then process the returned records. // Replace the
form and field link names before use.
confirmed_bookings = Hotel_Booking[Booking_Status == "Confirmed"];
for each booking in confirmed_bookings { // Process only the
fields required for this task. info booking.ID;
}
```

Validation / Discussion

Compare before/after observations using the same data and conditions. Do not claim a numeric speed improvement unless it was measured. Platform performance also depends on account limits, data volume, and network conditions.

Result

Optimization opportunities and a repeatable validation method are documented.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
