EXPERIMENT 11: Development, Testing and Production Release

Aim: To describe a controlled release process for moving changes to the hotel booking app into use.

Requirements: Development copy or test environment, production app, sample test data, and a release checklist.

Procedure

1. Make changes in a development or test copy where available.
2. Test creating a guest, adding a room, submitting a booking, validating dates, calculating amount, and changingbooking status.
3. Test negative cases: check-out before check-in, missing guest, unavailable room, and overlapping booking dates.
4. Review permissions and workflow notifications before release.
5. Back up or document the current configuration and define a rollback plan.
6. Publish or deploy using the supported Zoho Creator release process, then run a short post-release smoke test.

Design / Test Table

Test case	Expected behavior
Valid date range	Booking can proceed to the configured next step
Check-out on/before check-in	Submission is blocked or a clear validation message appears
Room already booked for overlapping dates	Conflicting booking is rejected or flagged
Receptionist opens admin settings	Access is denied if permissions are configured correctly
Release smoke test	Forms, reports, and key workflows still operate

Validation / Discussion

Record the date, environment, tester, result, and evidence for each test. Do not label the app as production-deployed unless the actual publication step has been completed.

Result

A release checklist and essential acceptance tests are prepared for the hotel booking system.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
