EXPERIMENT 13: Low-Code Limitations: Hotel Booking Case Study

Aim: To evaluate the benefits and limitations of building a hotel booking system with a low-code platform.

Requirements: The proposed Hotel Booking application design and a list of operational requirements.

Procedure

1. List core requirements: guest registration, room catalogue, booking dates, availability, booking status, and reports.
2. Identify features that can be implemented with forms, reports, workflows, and Deluge.
3. Identify requirements that may need careful custom logic or external services, such as payment processing,complex multi-property inventory, channel-manager synchronization, or high-volume integrations.
4. Evaluate platform limits, licensing, data export, integration permissions, and maintainability.
5. Choose whether each requirement should remain low-code, use a custom function, integrate with another service,or be deferred.
6. Document trade-offs and risks before expanding the system.

Design / Test Table

Requirement	Low-code fit	Consideration
Guest and room forms	High	Field validation and access permissions
Basic booking workflow	High	Must test date overlap logic
Operational reports	High	Ensure filters and totals are correct
Online payment processing	Integration-dependent	Use a trusted payment provider; do not store card details
Multi-channel live inventory	May be complex	Requires reliable synchronization and conflict handling
Very high-volume processing	Needs evaluation	Measure actual platform and plan limits

Validation / Discussion

Review each requirement with a stakeholder and label it as supported, needs integration/custom logic, or out of scope. This is a case-study assessment, not proof of a deployed enterprise system.

Result

The suitability and limitations of Zoho Creator for a hotel booking use case are assessed.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
