EXPERIMENT 14: Pro-Code Extension with Deluge Custom Functions

Aim: To use Deluge logic to support booking validation and amount calculation beyond basic form configuration.

Requirements: Hotel Booking form with Check_In, Check_Out, Room lookup, Rate_Per_Night, Nights, and Total_Amount fields.

Procedure

1. Confirm the field link names and data types in the app.
2. Create a form validation workflow or custom function appropriate to the use case.
3. Check that the check-out date is later than the check-in date.
4. Calculate the number of nights and multiply by the applicable room rate.
5. Before confirming a booking, check for overlapping confirmed bookings for the selected room.
6. Test valid and invalid inputs and inspect the saved record.

Illustrative Deluge / Integration Template

```
// Illustrative Deluge logic for a form workflow.
// Adapt syntax, field link names, and workflow placement
// to your actual Zoho Creator form. if(input.Check_Out
<= input.Check_In) { alert "Check-out date must be after
check-in date."; cancel submit; } else { nights =
input.Check_In.daysBetween(input.Check_Out); input.Nights
= nights; if(input.Room != null) { input.Total_Amount =
nights * input.Room.Rate_Per_Night; }
}
```

Validation / Discussion

This is a template and may need syntax adjustments for the workflow context and lookup field structure. Test the date comparison, lookup dereference, and cancel-submit behavior in Creator. A complete overlap check must compare the selected room against other confirmed bookings where existing check-in is before the new check-out and existing check-out is after the new check-in.

Result

A custom-logic approach for date validation and booking amount calculation is documented for implementation and testing.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
