EXPERIMENT 15: Careers and Future of Low-Code Development

Aim: To understand career paths and future opportunities associated with low-code platforms and business application development.

Requirements: Research on low-code platforms, business automation, and the skills used in the Hotel Booking project.

Procedure

1. Identify roles related to low-code development, business analysis, workflow automation, application support, and integration development.

2. Map project tasks to skills: form design, data modeling, reports, permissions, workflow design, Deluge, testing, and documentation.

3. Explain how low-code development can speed up delivery while still requiring requirements analysis, security, testing, and maintenance.

4. Identify complementary skills such as APIs, JSON, OAuth concepts, database design, version control, and user experience.

5. Prepare a short presentation showing the hotel booking problem, solution, workflow, test evidence, limitations, and lessons learned.

Design / Test Table

Career path	Relevant project evidence
Low-code application developer	Forms, reports, workflows and Deluge logic
Business process analyst	Booking process and requirements mapping
Automation / integration developer	Authorized service integration and error handling
Application support specialist	Role tests, troubleshooting and release checklist
QA / test analyst	Acceptance tests, negative cases and evidence

Validation / Discussion

The presentation should use screenshots from the student's own app and clearly distinguish implemented features from proposed features. Cite any external career or platform sources used in the final submission.

Result

Career opportunities and transferable skills demonstrated by the hotel booking project are summarized.

Evidence to attach

Add your own Zoho Creator screenshots showing the relevant form, report, workflow or permission setting, plus the test records and observed outcome. Do not use illustrative code or expected results as proof that a live feature has been executed.
